## Predicting the Wheat Flour Size Segregation Process From Particle Properties

KALIRAMESH SILIVERU

Research Associate
Dept. of BAE / USDA - ARS
Contact: kaliramesh@ksu.edu

## Introduction

- Majority of wheat is converted into flour
- Color, genetics, hardness, and growing season - 6 classes

Mill flow sheet

(Roller mill flow sheet, SH 101)

## Sieving Process

- Three important particle motions (Nicholas et al., 1969):
- Filtration of fines through the matrix of powder on the mesh
- Free passage of particles through the mesh
- Interrupted passage or blinding of particles in the mesh
- Loss in throughput is observed when sieving soft wheat flour compared to that of hard wheat flour (Neel and Hoseney, 1984).
- Particle size of wheat flour affects its physicochemical properties (Wang and Flores, 2000).

Hard wheat Flour

## Soft wheat Flour

## Kansas State

UNIVERSITY

## Flour Cohesion

## approaching <br>  <br> 

further cohesion

bridge rupture

Flour cohesion depends on:
a) Physical
b) Chemical
c) Surface Properties

Research hypothesis: Flour particle characteristics affects the sifting behavior of wheat flour.

## Research Objectives

- Objective: 1 - Determination of surface physical and chemical characteristics of hard and soft wheat flours.
- Objective: 2 - Determination the significance of physical and chemical characteristics on the bulk cohesion of wheat flours.
- Objective: $\mathbf{3}$ - Develop a correlation to predict the flow behavior of wheat flours.
- Objective: 4 - Develop and validate of discrete element method (DEM) model to describe the wheat flour sieving process.

## Surface Characteristics

- Determination of surface physical and chemical characteristics of hard and soft wheat flour particles.
- Surface lipid content
- Shape factor
- Surface roughness

## Materials

Flour from:

- Hard red winter wheat
- Soft red winter wheat

45,75 , and $90 \mu \mathrm{~m}$ particle size

- Lab scale milling - AACC method (26-21.02; 26-31.01)
(Particle size selection : Neel and Hoseney, 1984)

## Methods

| Property | Test |
| :--- | :--- |
| Surface lipid | Surface staining - Sudan IV dye, and Ethylene glycol <br> (Chiffelle and Putt, 1951) <br> $>0.35 \mathrm{~g}$ dye $/ 100 \mathrm{ml}$ ethylene glycol <br> $>$ Program written in MATLAB |
| Shape factors <br> $>$ Form factor; Roundness <br> $>$ Aspect ratio; Compactness | Scanning Electron Microscopy images $\times 500$ magnification <br> $>$ Shape descriptors plug in (V 1.48) in ImageJ |
| Surface roughness | Atomic force microscopy <br> $>R_{q}=\frac{1}{N} \sqrt{\sum_{i=1}^{N}\left(Z_{i}-Z_{\text {ave }}\right)^{2}}$ |

## Surface Lipid Composition

## Surface lipid composition

** Values with same letters on a column are not significantly different for a particular size by least significant difference (LSD) comparison of means. $(\alpha=0.05)$

## Kansas State

## Shape Factor

- Shape factor - Shape descriptors plug in (V 1.48) in ImageJ
- Shape descriptors - form factor, roundness, aspect ratio, and compactness

Interlocking in circular and irregular particles

## Shape Factor

Range of values of shape factors from the regular shapes.

## Kansas State

## Shape Descriptors

Measured Shape Descriptors values

3D topography of HRW $90 \mu \mathrm{~m}$ and SRW $90 \mu \mathrm{~m}$ particles. Scan size $5 \times 5 \mu \mathrm{~m}$ and scan rate of 1-2 Hz.

Number of Areas having RMS Surface Roughness in Various

## Surface characteristics: Conclusions

- The surface lipid composition and roughness were higher in soft wheat flours.
- The breakage behavior of flour components (protein and starch) influenced the overall shape and surface roughness of wheat flour.
- The irregular shape of the particle causes inter-locking behaviour between particles which could affect flour movement during sieving.
- The differences in surface characteristics could lead to agglomeration of flour particles that could affect the sieving process and also affects the product quality and uniformity.

## Bulk Cohesion Method

FT4-Powder rheometer

Shear cell measurement

## Results

| Sample | Cohesion, kPa |  |  |
| :---: | :---: | :---: | :---: |
|  | 0.5 kPa | 1.0 kPa | 1.5 kPa |

## Kansas State

## Bulk cohesion: Conclusions

- High correlation between the physical independent variables (MC, PS, SL), chemical composition (damaged starch, protein, and fat) and the flow properties (cohesion, flow function, and AIF).

Moisture: 12\% (w.b)
Particle size: $<\mathbf{4 5} \mu \mathrm{m}$
Sifter load: $\mathbf{1 . 0} \mathbf{~ k P a}$

## Predicting Flow Behavior

- Development of granular bond number (GBN) model for predicting flow behavior of wheat flours.
- Hard red winter flour
- Soft red winter flour
$\left\{\begin{array}{l}\text { Size range } \\ \text { a. } 75-106 \mu \mathrm{~m} \\ \text { b. } 45-75 \mu \mathrm{~m} \\ \text { c. }<45 \mu \mathrm{~m}\end{array}\right.$

Moisture content: 12 \% (w.b)
Applied pressure: 1.0 kPa

## Methods

| Property | Test |
| :--- | :--- |
| Particle characteristics | Morphologi G3-ID morphologically directed Raman |
| $>d_{p}$ - particle diameter | system (Malvern Instruments, Worcestershire, UK) |
| $>d_{\text {asp }}$ - asperity diameter | $>$ Dry dispersion 0.5 bar |
| $>d_{32}$ - Sauter mean diameter | $>125$ images |
| Surface energy | Inverse gas chromatography (IGC-SEA, Surface |
|  | Measurement Systems, London, U.K.) |
|  | $>A=24 \pi D_{0}^{2} \gamma_{d}$ (Israelachvili, 1992) |

|  | $>33.3 / 33.3 / 33.3$ |
|  | $>16.6 / 41.7 / 41.7$ |
|  | $>41.7 / 16.6 / 41.7$ |
|  | $>41.7 / 41.7 / 16.6$ |

## Model Development

- Cohesive force

$$
\begin{aligned}
& >F_{\text {cohesion }}=\frac{A}{12 z_{0}^{2}}\left(\frac{d_{p}}{2\left(^{H_{0}} / z_{0}\right)^{2}}+\frac{3 d_{\text {asp }} d_{p}}{d_{\text {asp }}+d_{p}}\right) \\
& >A=24 \pi D_{0}^{2} \gamma_{d}
\end{aligned}
$$

- Granular Bond number $\left(B o_{g}\right)$

$$
\begin{aligned}
& >B o_{g}=\frac{F_{\text {cohesion }}}{W_{g}} \\
& >f f_{c}=\alpha\left(B o_{g}\right)^{-\beta} \\
& >S E P=\sqrt{\frac{\sum\left(Y-Y^{\prime}\right)^{2}}{N}}
\end{aligned}
$$

Where, A - Hamaker constant $d_{p}$ - particle diameter
$d_{a s p}-$ asperity diameter
$H_{0}$ - separation distance
$z_{0}$ - equilibrium separation distance
$\gamma_{d}$ - surface energy
$D_{0}$ - cut-off distance
$W_{g}$ - particle weight
$\alpha, \beta$ for Hard wheat flours $-53.68,0.43$
for Soft wheat flours - 63.38, 0.45

## Results

## Kansas State

UNIVERSITY

## Predicting Flow: Conclusions

- The GBN model quantifies inter-particle cohesion and correlates well with the FF.
- The GBN model predicted the flow behavior of powders at particular particle size with SEP of 0.05 for HRW and SRW wheat powders.
- The GBN model was extended to multi-component mixtures (powder with different particle sizes) and was successfully predicted the FF.
- Anticipated applications include:
- Corrective actions to increase or decrease sieving time
- Change in sifter settings
$\frac{\text { Kansas State }}{\text { U N } 1 V E R S i t y}$
UNIVERSITY

## DEM Modeling of Sieving Process

- Development of discrete element method (DEM) model for sifting flour
- Numerical modeling technique.
- Based on principles of Newton's second law of motion and forcedisplacement laws.
- Particles representing material in behavior and characteristics are created based on the physical and mechanical properties.
- Model follows motion and interactions of each particle and predicts their motion.

## DEM Modeling: Conclusions

- The developed model is helpful in predicting the particle size distribution on each sieve.
- Prediction of sieve blinding time:
- HRW @ $10 \%$ m.c- 15.25 s
- HRW @ $14 \%$ m.c-10.50 s
- SRW @ $10 \%$ m.c - 10.25 s
- Mass retained over $125 \mu \mathrm{~m}$ sieve
- For HRW $14 \% \mathrm{mc}$ is $12 \%>$ HRW at $10 \%$ m.c
- For SRW $10 \% \mathrm{mc}$ is $8 \%>$ HRW at $10 \%$ m.c
- Based on the predicted sieve blinding times corrective actions like:
- Modification of sieving time can be done
